Hydraulic Replacement Filter Elements

for CC Jensen™ Stacked Disc Filter Inserts

Performance under any pressure.

Protection against particles, water, and fluid breakdown by-product is a critical function for today's hydraulic filtration systems. Off-line filtration systems can be applied to restore and maintain proper fluid cleanliness where OEM specified on-board filtration is insufficient, or retrofits are needed to properly manage critical hydraulic filtration.

Now available: Donaldson hydraulic replacement filter elements with full flow pleated design with glass fiber media provide dependable protection and reliable quality. They are manufactured, tested and proven to perform, designed to deliver required cleanliness while optimizing dirt capacity. With lower pressure drop and greater efficiency, they ensure cleaner fluid, longer filter life and better protection for your equipment.
